

Some might look at this graph and think, “boring.”
But this isn’t about the graph - it’s about the process behind it.

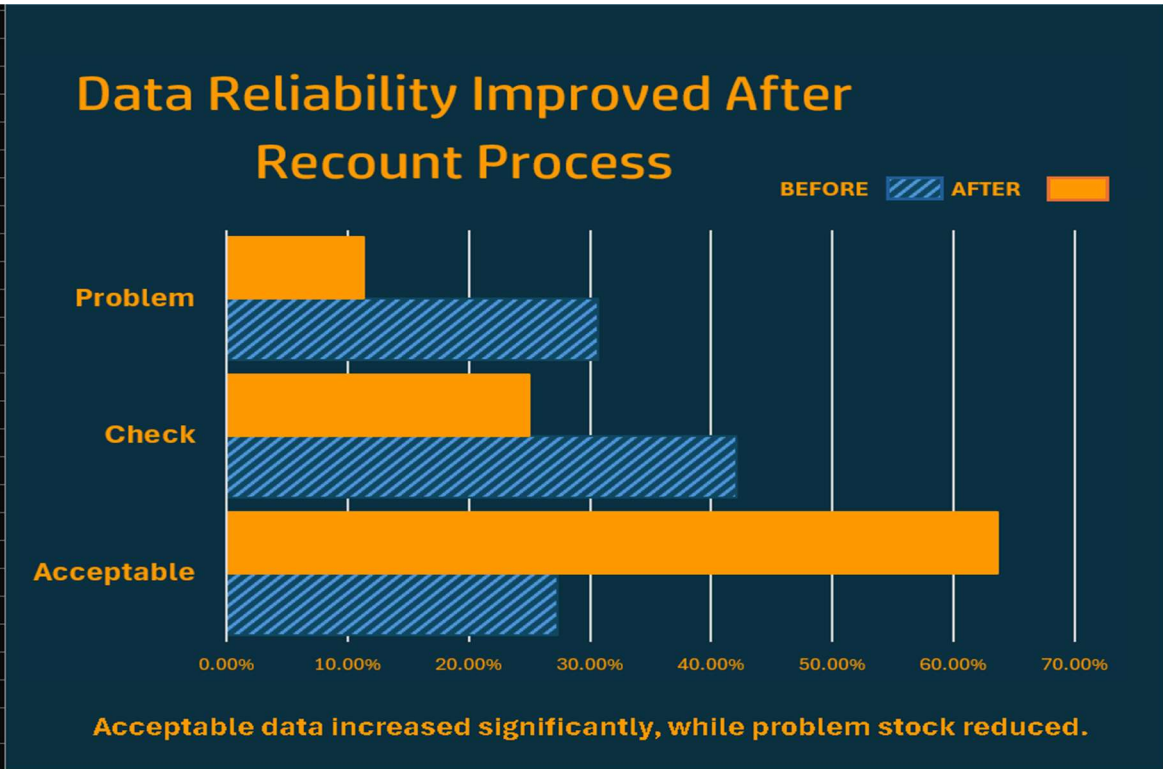

Impact of Recount Process

Status	Before	After
Acceptable	27.27%	63.64%
Check	42.05%	25.00%
Problem	30.68%	11.36%

Shows impact Before and After

The first version uses a stripped-back visual language to show technical clarity. The second applies a business visual language aligned with the organisation I analyse for.

Same data. Two visual languages. One operational goal.

The purpose of the **FMCG Demand Planning & Data Validation System** was to build an operational framework robust enough to transform raw, inconsistent data into a format that can be trusted for demand planning.

The system validates, corrects, and re-evaluates data reliability before planning decisions are made - reducing the impact of over-stocks and short-stocks on both sales and cash-flow. Reliable decisions don't require perfect data. They require systems that can identify what can be trusted.
